# Every order checked before it leaves.

Live tickets you run by voice, and a phone over the packing spot that checks every bag before the courier walks out.

DOORDASH HACKATHON · FRONT OF HOUSE AT PEAK · ROMIR PATEL

YESTERDAY · CHIPOTLE ON DOORDASH

# Two mistakes in one bag.

Ordered: hard shell tacos

## Got soft shell.

Would’ve been caught

Ordered: kids meal

## No drink in the bag.

Would’ve been caught

By the time I opened the bag, the courier was long gone. A ten-second look at the counter would have fixed both.

WHAT THE PASS CAMERA WOULD HAVE SAID

# Caught at the counter, not at home.

## × Wrong and missing items

Your order · Chipotle · DoorDash

ok · Kids meal

wrong · Tacos are soft shell, ticket says hard

missing · Kids meal drink

Read from the photo · flagged before pickup

01

The phone over the packing spot sees the bag settle.

02

It matches every item to the ticket.

03

It says what’s wrong, out loud, while the bag is still on the counter.

THE PROBLEM · DOORDASH'S TWO CHALLENGES

# Timing and packing break at peak.

01 · PREP TIMING

## When should this order start cooking?

Orders arrive from different apps with different timing, and pickup times move. Start too early and food sits; too late and the Dasher waits.

*How can AI help coordinate prep and timing?*

02 · PACKING & PICKUP

## Is this bag right, and is it theirs?

Cooked isn't done. Everything has to be packed right and handed to the right person, and every fix steals time from the next order.

*How can AI make pickup more reliable, with less work for staff?*

OUR SOLUTION

# Handoff: an AI expo for the pass.

01 · TICKETS

## Start each order on time.

Every app on one rail. Each ticket counts down to its start time, worked back from when the Dasher arrives.

02 · VOICE

## “Start the timer for order 45 steak.”

Timers set themselves from the dish and the doneness. Ring in orders and ask “what’s late?” hands-free.

03 · PASS CAMERA

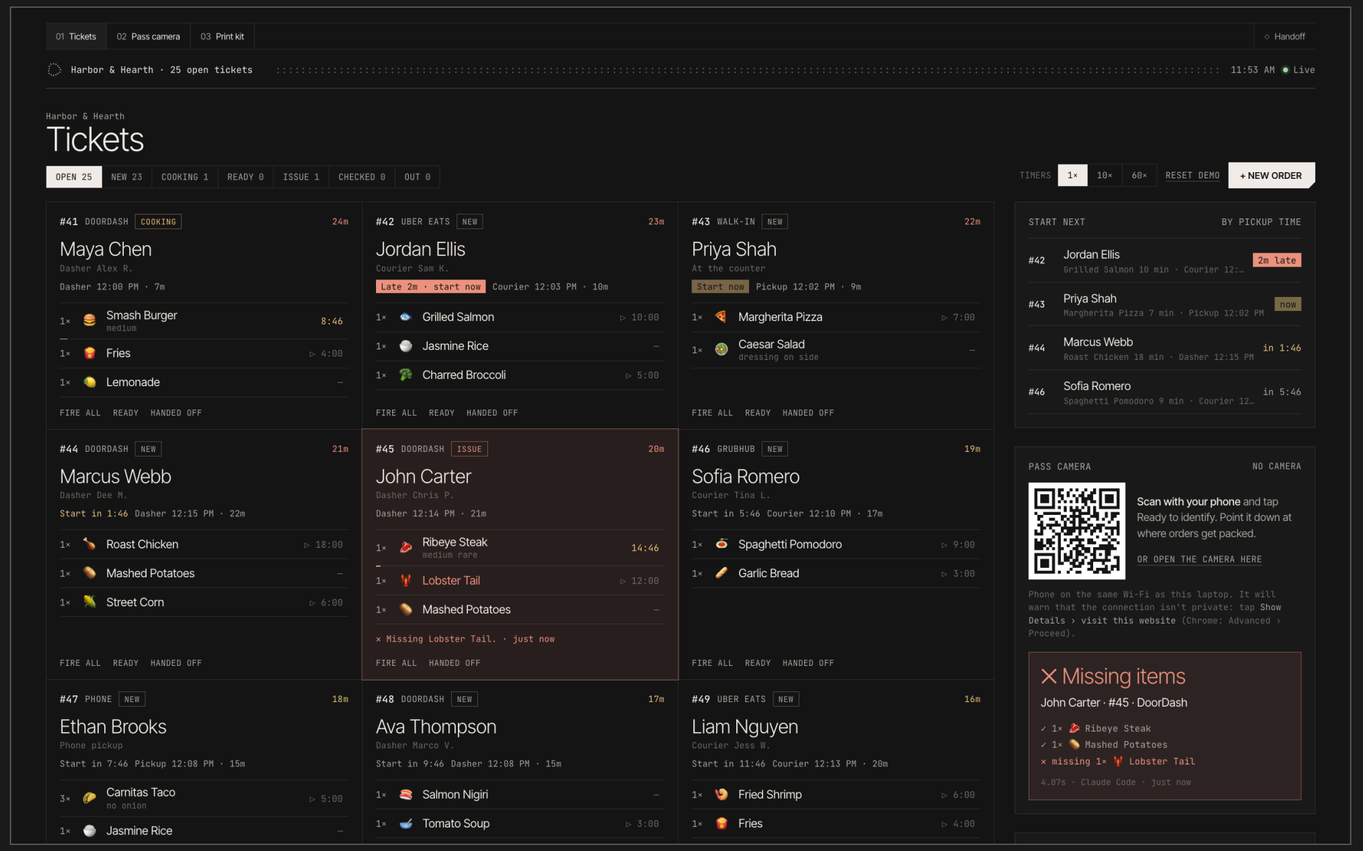

## Green means go.

A phone over the packing spot names the guest, checks every item, and flags what’s missing or extra.

TICKETS + VOICE TIMERS → 01 PREP TIMING · PASS CAMERA → 02 PACKING & PICKUP

BUILT AND RUNNING

# What the pass sees.

### 01 · Start next

Every ticket says when to start, worked back from its Dasher's arrival.

### 02 · Voice

Timers, new orders and "what's late?", all by voice.

### 03 · Issue

Order 45 turns red: the lobster tail isn't in the bag.

### 04 · Pass camera

The phone's answer, read from the photo in under 4 seconds.

HOW IT RUNS

# One order, start to finish.

01

## Ticket lands

#45 · DoorDash. Dasher in 21 min, steak takes 15: start in 4.

02

## Say it

“Start the timer for order 45 steak.” Medium rare: 15:00.

03

## Bag it

Slide it under the phone. It checks when the bag settles. No buttons.

04

## Phone answers

Go: “Good to go, John.”

Hold: “Missing lobster tail.”

The answer is spoken from the phone at the pass, so the packer hears it without looking up.

HOW IT USES AI

# Vision reads the bag. Code makes the call.

Phone camera

## Snaps the bag

When motion stops. Nobody taps.

→

Claude Sonnet 5.5

## Names every dish

Answers only in menu ids and counts.

→

Matcher · code

## Finds the ticket

Scores every open order on overlap, missing, extra.

→

Verdict

## Go or hold

Green with the guest's name, or red with what's wrong.

Browser speech

## Hears the cook

Always listening, hands-free.

→

Parser · code

## Splits it by order

Orders, tables, dishes, doneness, questions.

→

Timers

## Sets the right time

From dish and doneness: rare 12, medium 17.

Next · Gemma

## Go/hold on the phone

Planned: post-trained on our checks, runs offline.

WHY IT WORKS

# Built so it can’t quietly be wrong.

## The model only looks.

Claude lists what’s in the bag. Matching and the go/hold call are plain code we can read and test.

## It can only name menu items.

Its answer is locked to the restaurant’s menu, so it can’t invent a dish that isn’t sold.

## About 4 seconds a bag.

3.5–5 s per check in our tests, read from the photo alone. Nobody presses a button.

## Service never stalls.

If the model can’t be reached, it reads the codes printed on our cards and bag labels instead.

WHAT’S NEXT · ROADMAP

# A Gemma decision model on the phone.

01 · Collect

## Every check is a lesson.

The photo, the ticket, and whether staff agreed with the call.

02 · Post-train

## Teach Gemma the go / hold call.

Fine-tune an open Gemma vision model on those labeled checks.

03 · On device

## Decide offline.

Runs on the phone, no per-check cost. Claude stays the second opinion on close calls.

Also next: tickets straight from DoorDash, and the Dasher confirms pickup by name before the bag leaves.

◇ HANDOFF

# Now, for a live demonstration!
